

Is the front passenger seat always the “death seat”?

An application of hierarchical ordered model for occupant injury severity

Background

Research Objective

Seat Positions

- Driver seat
- Front left passenger seat
- Front middle passenger seat
- Rear left passenger seat
- Rear middle passenger seat
- Rear right passenger seat

Correlation

Occupant Injury Severities

- No visible injury
- Moderate injury
- Severe injury
- Fatal

Modeling Framework

Research Question- How to account for injuries of all occupant in a crash?

Modeling Framework

- Hierarchical Ordered Model

$$p_{ij} = \Pr(y_{ij} = c | X_{ij}, v_j) = \frac{1}{1 + \exp(-\gamma_c + X_{ij}\beta + Z_{ij}v_i + \epsilon_{ij})} - \frac{1}{1 + \exp(-\gamma_{c-1} + X_{ij}\beta + Z_{ij}v_i + \epsilon_{ij})}$$

- y_{ij} = injury severity of occupant j involved in crash i ;
- c = injury severity level, $c = 1, 2, 3$, and 4 ;
- X_{ij} = a $(1 \times p)$ vector of covariates corresponding to fixed effects;
- β = fixed effects parameter for covariates X_{ij} ;
- Z_{ij} = a $(1 \times q)$ vector of covariates corresponding to random effects;
- v_i = random effects parameter at crash event level;
- γ_c = threshold value for injury severity level c , $\gamma_0 = -\infty$ and $\gamma_4 = +\infty$;
- ϵ_{ij} = model residuals $\epsilon_{ij} \sim N(0, \delta^2)$.

Data

- Dataset about road crash
- South Australia
- From 2012 to 2016
- 20,347 occupant injuries in 16,420 motor vehicle crashes (after data cleaning and error check)

Source: https://en.wikipedia.org/wiki/South_Australia

Data

Injury Severity	Frequency
No Visible Injury	35.08%
Moderate Injury	56.62%
Severe Injury	7.03%
Fatal	1.26%

N = 20,347 occupants

Seat Positions	Frequency
Driver seat	78.39%
Front middle passenger seat	0.05%
Front left passenger seat	15.05%
Rear right passenger seat	2.78%
Rear middle passenger seat	0.78%
Rear left passenger seat	2.96%

Bucket seat

From Wikipedia, the free encyclopedia

A **bucket seat** is a car seat consisting of two separate seats designed to fit multiple people. It is typically found in vehicles with high sides, but may have side-impact protection in high-performance automobiles.

Bucket seats first appeared in the 1930s on European cars with floor-mounted steering columns. They were typically standard in front-wheel-drive cars, turning at speed. Rear bucket seats were being contoured generally, and thus lacking adjustability.

Bench seat

From Wikipedia, the free encyclopedia

This article **needs additional citations for verification**. Please help improve this article by [adding citations to reliable sources](#). Unsourced material may be challenged and removed. *(August 2013)* [\(Learn how and when to remove this template message\)](#)

The **bench seat** was the traditional seat installed in American and Australian automobiles. This seat featured a continuous pad running the full width of the cabin. The second row of seating in most sedans is usually a bench. The third row of most SUVs and minivans, which may be forward-facing or rear-facing, is also a bench seat.

Design [edit]

The front bench seat typically allowed three people to sit abreast, or six passengers in most four-door sedans with this type of arrangement. For example, "although advertised as an economical 'compact' car, the [1952] [Willys Aero](#) could comfortably sit three abreast on its front and rear bench seats, and deliver excellent fuel economy."^[1] [Nash Motors](#) introduced the unique "airliner" reclining front bench seats that would be transformed into a bed.^[2] [American Motors](#) promoted its exclusive adjustable bench seats on the 1959 [Ramblers](#) and [Ambassadors](#) featuring several restful positions, including a "comfortable nap couch for children and older adults."^[3] In 1972, the [Jeep Commando](#)'s center console for the automatic transmission was replaced with a steering column mounted shifter, "making the much-requested bench seat an option."^[4] The "innovative but unusual" 1975 [AMC Pacer](#) introduced numerous designs that included the "cab forward" and "room for three upfront on the bench seat."^[5]

The **bucket seat** arrangement leaves a space between the two front seats, usually occupied by a shifter and hand brake. Originally, bucket seats were associated with

Fiat 600 Multipla with bench seat

1967 AMC Ambassador with a reclining front bench seat offering room and seat belts for three adults

Model Results

Variables (Dependent variable = injury severity)		β	P > z	[95% Conf. Interval]

Some Insights

- Likelihood of severe injuries in a car crash:
 - front middle > rear middle > rear right > rear left > front left > driver seat
